```
34.              person::set_name($new_name);
35.          }
36.    }
37.
38.    function __construct($employee_name) {
39.          $this->set_name($employee_name);
40.    }
41. }
42. ?>
```

STEP 23: Overriding methods: Part 3

Using :: allows you to specifically name the class where you want PHP to search for a method - 'person::set_name()' tells PHP to search for set_name() in the 'person' class.

There is also a shortcut if you just want refer to current class's parent: by using the 'parent' keyword.

```
1.   <?php
2.   // explicitly adding class properties are optional - but is good
3.   // practice
4.
5.   class person {
6.        var $name;
7.
8.        function __construct($persons_name) {
9.             $this->name = $persons_name;
10.       }
11.
```
